

Another Problem Solved by PipeServ

Location: Papua New Guinea

Application: Valve Installation

PipeServ was asked to assist with the modification of diesel piping to allow for a new valve to be installed. This was to replace an existing valve but the new valve was longer and the pipe needed to be modified to suit and a new flange installed.

Having previous experience with Lokring fittings; the pipeline owner went ahead with the installation using a Lokring flanged fitting. Trained staff then proceeded to complete the installation and commissioning of the valve.

Major benefits experienced were:

- * Being able to install these valves without hot work
- * No purging, flushing, welding or NDT inspection
- * Speed of installation
- * Significant cost savings

This company now owns the Lokring tooling and with trained staff have continued to use Lokring for other repairs and installations.

Installation cost savings, fewer risks, improved safety and reduced loss of production. All good reasons to use Lokring fittings.
