

Another Problem Solved by PipeServ

Location: Western Australia, Australia

Application: Valve Installations

PipeServ was asked to assist with an alternative plan to install valves at a number of gas compressor stations. Each of these compressor stations were remote sites and the cost of installing these valves with traditional (welding & NDT) methods was very high due to the mob and de-mob costs for welding and NDT crews.

After reviewing of Lokring fittings; the pipeline owner approved the use of Lokring pipe fittings. Lokring 2" 600# Flanges were used for the valve installations. Staff were trained in the installation of Lokring fittings and then proceeded to complete the installation at each site.

Major benefits experienced were:

- * Being able to install these valves without hot work
- * No purging, flushing, welding or NDT inspection
- * Speed of installation
- * Significant cost savings

This company now owns the Lokring tooling and with trained staff have continued to use Lokring for other repairs and installations.

Installation cost savings, fewer risks, improved safety and reduced loss of production. All good reasons to use Lokring fittings.
